FIG WORKING WEEK 2015

17-21 MAY SOFIA BULGARIA

INTRODUCTION

Precise gravimetric networks - First class national or regional gravimetric networks /relative gravimetric networks/

Mathematical model - main characteristics

- Configuration of network;
- Scheme of gravimetric measurements;
- Type of used relative gravimeter(s);
- Number of used gravimeters.

Realization of adjustment – main stages

- Defining of mathematical model;
- Preliminary and post-processing estimation;
- Assessment of optimal method for estimation;
- Assessment of quality of mathematical model and optimization criteria.

to the challenges of modern world"

FIG WORKING WEEK 2015
17-21 MAY SOFIA BULGARIA

PRELIMINARY AND POST-PROCESSING ESTIMATION OF MEASUREMENTS

Statistical series

- gravity readings
- gravity differences
- differences from repeated measurements with two or more gravimeters
- closures of figures
- repeated closures with two or more gravimeters
- residuals

Control for availability of gross and systematic errors (all series)

For distribution (all series)
/goodness of fit test/

A-priority RMS

Control for gross errors (residuals)
/detecting of outliers τ -test/

Control for drift and calibration

Control for availability of correlation and autocorrelation (residuals)

Global test (residuals)

/control for correct and complete model/

Significance of parameters (residuals)

Statistical hypothesis

Ensures:

- Absence of gross and systematic errors
- Accounting of correlation and autocorrelation
- Correct and complete model

ASSESSMENT OF OPTIMAL METHOD FOR ESTIMATION

Assessment depends on

- Type of measurements –
 - complexity of factors influencing the measurements and determining their accuracy
 - Direct or indirect method type of measurements
- Assurance that the mathematical model presented sufficiently and accurate measurements

Relative gravimetric measurements:

- Indirect
- Complex, various and difficult for modelling factors are influencing (internal and external)
- Availability of disturbances (shocks and vibrations)
- External disturbances (atmospheric changes, humidity, etc.)
- Internal disturbances (mechanical hysteresis, elastic relaxation)

Robust estimation methods

$$G = (1 - \epsilon)F + \epsilon H$$

Expecting not only normal distribution of errors but availability of additional contaminated distribution

ASSESSMENT OF QUALITY OF MATHEMATICAL MODEL AND OPTIMIZATION CRITERIA

"From the wisdom of the ages to the challenges of modern world"

FIG WORKING WEEK 2015
17-21 MAY SOFIA BULGARIA

BASIC GRAVIMETRIC NETWORK OF REPUBLIC OF MACEDONIA

Configuration:
 Absolute points = 3 pts
 First order gravity points = 25 pts
 Figures = 41 triangles
 Connections = 68 differences

Scheme of measurement:
 star/difference method
 (1-2-1'-3-1'')
Two gravimeters simultaneously:
 Scintrex CG3+ and CG-5

Linear drift model:
 $d_{12}(1-2-1')$; $d_{13}(1'-3-1'')$
Calibration measurements:
 three times

BGNM of RM – studied variants of mathematical models

Two Functional Models

- Observation equations
 - Gravity differences
 - Preliminary eliminated parameters For Drift model and Calibration model

Based on *Arithmetical and Proportional mean readings in each gravity station*

- *Arithmetical differences model*
- *Proportional differences model*

Three Stochastic Models

- Defined with Weights
- Diagonal structure - Uncorrelated measurements

- *Equal weights model*
- *Reciprocal to time model*
- *Depending on RMS (of gravity differences model)*

12 Base Mathematical Models for measurements with Gravimeter CG3+ and Gravimeter CG5

Models with applied Danish method

Depending on weights for gravimeters Models

FIG WORKING WEEK 2015
17-21 MAY SOFIA BULGARIA

BGNM of RM - Preliminary and post-processing estimation

Stochastic characteristics of input data (distribution)

- Gravity differences
- Closures of figures

Absence of gross and systematic errors on different stages of processing

- Series of gravity readings \ Gravity differences \ Closures of figures
- Residuals (τ -test)

Correct models for drift and calibration

- Gravity differences
- Differences between Closures of figures

Detecting of availability of correlation and autocorrelation between errors and time

Correct and complete model (by global test)

Significance of parameters and model adequacy

FIG WORKING WEEK 2015
17-21 MAY SOFIA BULGARIA

BGNM of RM – Adjustment results for the different models for CG3+ and CG5

Used characteristics: **M-criterion** (M) g (arithmetical mean error); **Sum of residuals** [pv] and **Studentized residuals** [v/mv]

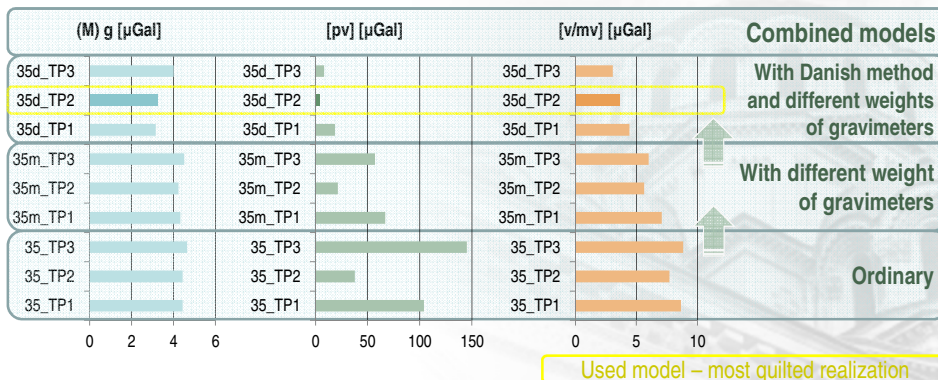

"From the wisdom of the ages
to the challenges of modern world"

FIG WORKING WEEK 2015
17-21 MAY SOFIA BULGARIA

BGNM of RM – Adjustment results for the combined models

Used characteristics: **M-criterion** (M) g (arithmetical mean error); **Sum of residuals** [pv] and **Studentized residuals** [v/mv]

"From the wisdom of the ages
to the challenges of modern world"

FIG WORKING WEEK 2015
17-21 MAY SOFIA BULGARIA

CONCLUSION

- **Appropriate structure of gravimetric network**
 - ✓ Guaranteed the control of the relative gravimetric measurements in preliminary and post-processing estimation of the accuracy
- **Realized scheme of measurements**
 - ✓ Important for the adjustment of gravimetric networks
 - ✓ defines the characteristics and the possibilities to form the mathematical model
- **Estimation method selection depends on**
 - ✓ the availability of a contaminant distribution in the measured quantities
- **Application of robust estimation method - Danish method**
 - ✓ established lower values of RMSs defining global accuracy of the network
 - ✓ optimal values for [pv]
 - ✓ optimal values for the sum of Studentized residuals [v/mv]
 - ✓ Absence of systematic or inadmissible errors is guaranteed
